

Spb Mobile Shell 3.5

Make Windows Mobile more usable with one simple application

Mobile Shell is probably our favourite application for the Windows Mobile platform. It offers a fully finger-friendly approach to Windows Mobile where Microsoft has failed to do so. With Mobile Shell you can access most of the most-used functions on your smartphone without ever needing to take the stylus out of its silo. It looks great, with plenty of flashy animations adding some much-needed pizzazz to the proceedings, but these never obstruct the core functionality of the app. It is also highly customisable, enabling you to set up work and personal home screens that you can easily switch between, each containing shortcuts to relevant apps.

The key feature in 3.5 is the addition of new widgets that enable you to update your Twitter or Facebook feeds direct from your home screen. In addition, you can view a full weather forecast, search the web, get (very flashy) previews of your incoming email and text messages and much more. Hardware features are also now taken advantage of, including gravity sensors and graphics accelerators, to give the app a smoother and more intuitive feel when in use.

Mobile Shell 3.5 is a free update to existing 3.x users and, though not the cheapest software, is one of those apps that will fundamentally change how you interact with your phone.

Overhaul the WinMob UI with help from Spb Mobile Shell 3.5
